

To whom it may concern,

We herewith confirm that our Chameleon 1x2 and 2x2 models are fully compliant and independently certified to the European norms relevant to UV Electric Fly Killers, the EN 60335-1:2002 & EN60335-2-59:2003, which include electrical safety tests.

The main chassis of these units is made out of metal and the lamp holders have flame retardant properties (UL 94 standard, V-2 rated). It is highly improbable that a starter repetitively seeking to start our UV fluorescent tubes will lead to a fire in normal industrial environments (excluding e.g.: ATEX zones). This statement applies to any brand of starters supplied by us and destined for fluorescent tubes being connected in series.

It is nonetheless recommended to routinely inspect the units to make sure they operate accordingly.

Yours faithfully,

Frédéric Hurstel
